

New Roc AI Training

AI That Works for New Roc

Ask Better Questions, Get Clearer Answers

Evis Plaku

Answer your toughest document questions faster;
and know they're right

- **Find** that buried clause or requirement in seconds, not hours
- Get a clear **summary** with proof of where the answer came from
- Use the **same** simple **method** on any document: specs, contracts, emails

We handle hundreds of pages daily.
AI can help us work smarter

- Searching a 200-page spec for one submittal requirement? AI finds it **fast**
- **Comparing** old and new contract language? AI spots the differences

- **Writing** a status email from meeting notes? AI drafts it in seconds

AI shines at spotting patterns, writing drafts,
and pulling out key points

- Turn a dense spec into a **one-page**
"Spec at a Glance" **summary**
- **Extract** all masonry submittals with
section numbers into a clean list
- **Draft** a first version of an email, proposal,
or scope statement

AI can **sound confident** while getting details **wrong**.
Always double-check

- **Makes up** section numbers or requirements that sound real but aren't there
- **Confuses** old requirements with new ones if documents aren't clear
- **Misreads** ambiguous language and may pick the wrong interpretation

We **always check AI's answer** against the original document before using it

AI drafts

You check

You Save

- **Spot** three things: section numbers, exact wording, and dates or changes
- If AI's answer doesn't match the PDF, that's normal; **edit** and **correct**

Your Toolkit Today

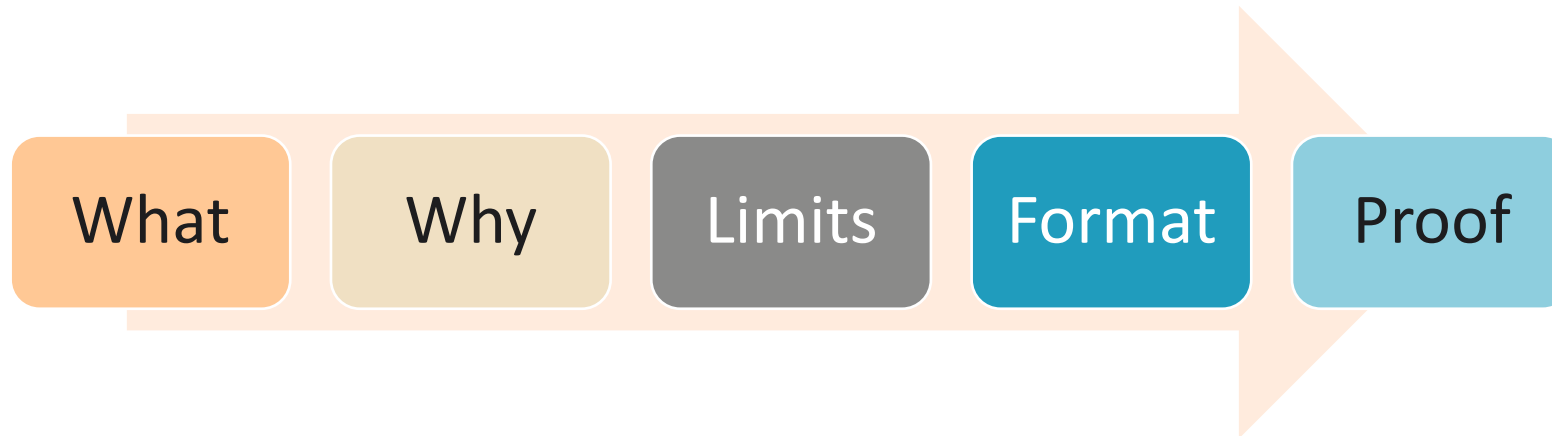

Three simple tools: ChatGPT to ask questions, PDF to verify, notes to save

- ChatGPT: Ask your questions, get answers with references to check
- PDF viewer: Jump straight to sections and confirm what ChatGPT said
- Shared notes: Save verified summaries and link them back to source files

Five simple parts:
what you want, why, limits, format, and proof

- Every question follows the same **five-step structure**, every time
- **Better questions** to AI = clearer, more **useful answers** back

Start with a **clear action**: Summarize, List, Extract, Find, or Explain

-  Vague: “Tell me about masonry.”  Clear: “List masonry requirements.”
-  Vague: “What does the contract say?”  Clear: “Find the payment terms.”

- **Be specific:** vague questions get vague answers

Explain **where** the info lives and **why** you need it.
AI will focus better

- “This is a New York City facade specification for a high-rise building.”
- “I need this to prepare a bid estimate and timeline.”

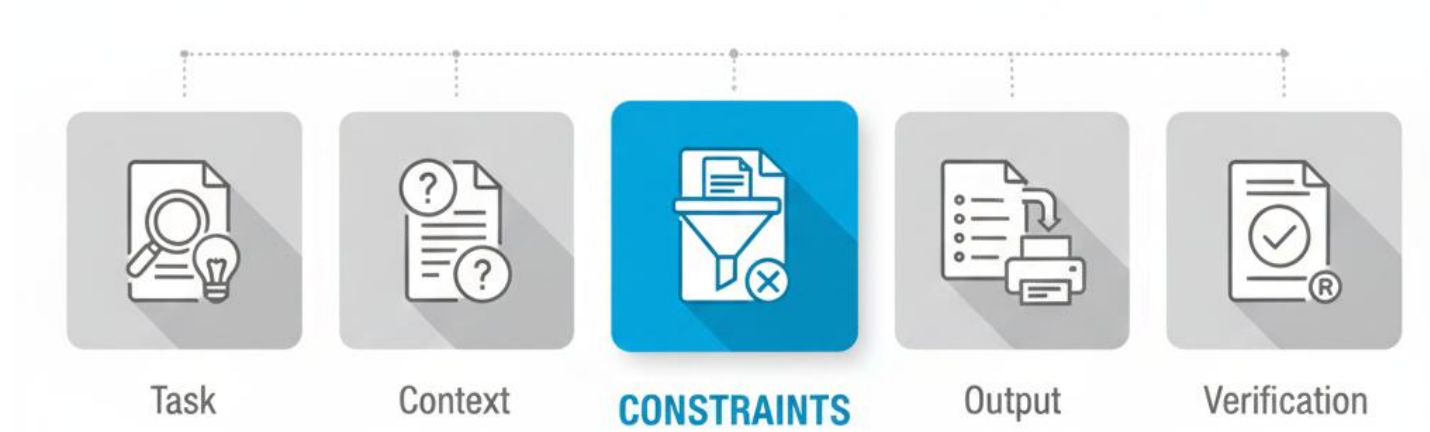

- Context helps AI understand what's important and avoid off-topic answers.

Tell AI what to ignore
so it doesn't mix up old and new info

- “Only look at Section 3. **Ignore** historical notes and appendices.”
- “**Focus** on current requirements, not superseded or alternative options.”

- **Constraints** prevent AI from wandering or pulling outdated information

Tell AI the **shape**: table, bullet list, paragraph.
Ready to use

- “Give me a **table**: Section, Item, Requirement, Page Number.”
- “**Bullet list** with section numbers so I can find each one.”

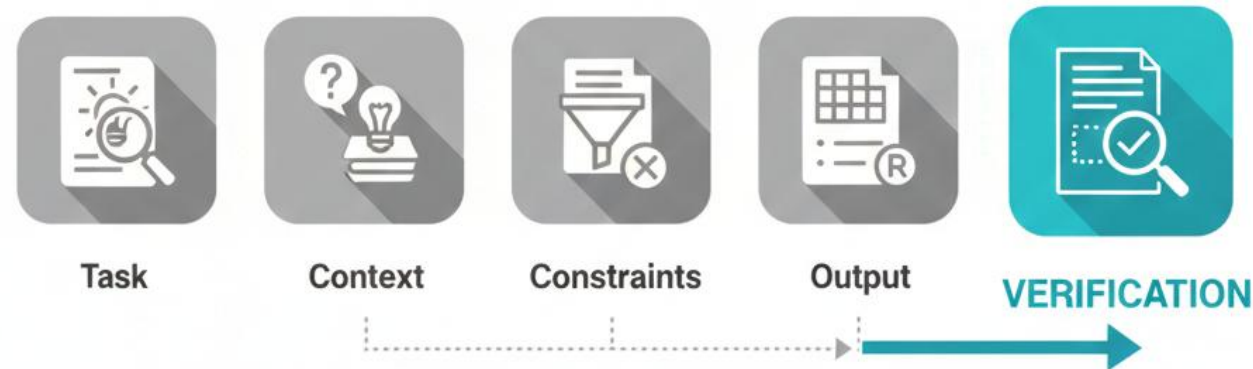

- **Right format** means you can copy straight into Excel or your notes

Tell AI to show you **where each answer came from** in the document

- “**Show** me which section and page number for each requirement.”
- “**Quote** the exact wording so I can check it matches the PDF.”

- This is the key: you always **know exactly** where to look to verify

A real prompt that uses all five steps.
Imitate this pattern

- **Task:** “List all masonry submittal requirements.”
- **Context + Constraints:** “From the NYC facade spec, Section 3 only”

- **Output + Verification:** “Format as a table with Section, Item, Requirement, and page number for each.”

Live Demo

Documents can be over 1,000 pages.
We'll break into sections, ask AI, then verify

- Real New Roc spec, real question, real verification process on screen
- You'll see where AI gets it right, where it needs correction, how we fix it
- Same method works for any section in any spec or contract

140 E. PROSPECT AVE.

140 E. Prospect Ave.
Mount Vernon, New York 10550

VOLUME 1: DIVISIONS 00 - 14

1234 pages

2 volumes

33 divisions

Over 1,000 pages means we can't ask ChatGPT to read the whole thing

- Extract one section first (e.g., Section 013300 Submittals, about 20 pages)
- Copy that section into ChatGPT; tell it to focus only on that
- Results are cleaner, faster, and easier to verify because scope is clear

We'll extract one section and ask a specific question about what's required

- 5-step prompt: task, context, constraints, format, verification

Section 013300
(Submittals)

Section 014000
(Quality & Testing)

Section 014339
(Mockups)

Extract

Ask AI

Get template

Use in project

Create habits to separate vague answers from clear, usable, verifiable results

- Be specific about what you want
 - ✗ "Tell me about submittals"
 - ✓ "List submittal requirements with section numbers"
- Set clear limits on scope
 - ✗ "Read the whole spec"
 - ✓ "Use only Section 013300, ignore alternatives"
- Say exactly how you want the answer
 - ✗ "Summarize it"
 - ✓ "Table with columns: Requirement, Section, Page, Notes"
- Always ask for proof
 - ✗ "Give me a list"
 - ✓ "Cite the exact section and page for every item"

Group

Challenge

You'll work in small teams.
Extract a section, craft a prompt, verify, correct

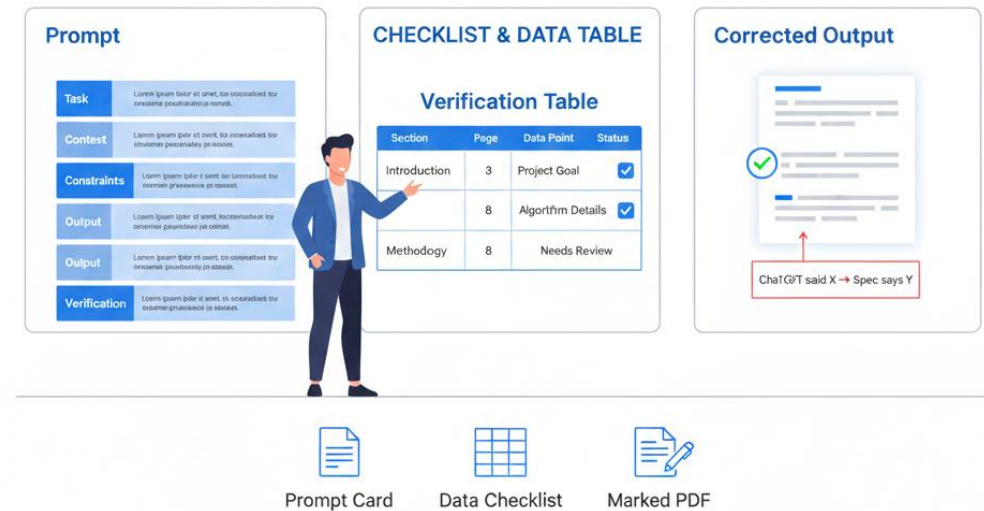

- Each group gets one real task: submittal checklist or mockup hold points + testing matrix
- You write the 5-step prompt together, run it in ChatGPT, then verify in the PDF

Your prompt, your output, proof you verified it, one thing you corrected

- Your 5-step prompt
- Your output (checklist/table with section references): screen share
- Your verification story: "ChatGPT said X, we checked the spec, found it was Y, so we corrected it."

Key Lessons

4A990A

Treat AI as a **fast research assistant**,
never as the final answer

- It helps us **find** and **summarize**,
but it still makes **mistakes**
- Our job is to **check** everything
against the original spec or contract
- We always **save answers** with
section references, page numbers, and links

One simple **five-step pattern** works on almost any document we handle

- Same steps for specs, contracts, SOPs, and long email threads
- Clear **task**, **context**, **limits**, **format**, and **proof** get better answers
- You can start using this pattern on your real projects

Your **questions** and examples will shape the playbook we build together

- What part of today felt most useful for your real projects?
- Where do you still feel unsure about using this method?

THANK YOU
